

## ANDERSON GREENWOOD SERIES 5200 PILOT OPERATED PRESSURE RELIEF VALVES

A modulating pilot operated pressure relief valve for economizer applications that meets the stringent requirements of ASME Section I at high temperatures

### FEATURES

- Increased system output with total valve tightness to 96 percent of set pressure without leakage.
- All plastic pilot seats and seals provide chemical compatibility with corrosion inhibitors in feedwater service.
- Balanced design ensures proper valve operation and lift unaffected by back pressure; pilot exhausts to main valve outlet with no effect on set pressure.
- Reduced product loss and pollution through soft seats for premium tightness before and after relief cycles.
- Modulating action minimizes flow and resultant noise during normal system upset, reducing noise abatement costs.
- Non-flowing pilot reduces seat wear and minimizes entrance of dirt and particulates.
- Easy, single set pressure adjustment is accurate and dependable.
- ASME Section I stamp for steam and water service; ASME Section VIII and Section XIII for steam also available.
- Rugged bracket pilot mounting protects against vibration and careless handling.

### GENERAL APPLICATION

The Series 5200 has ASME Section I certified capacities for both steam and water and uses a full nozzle design and metal main valve seat to meet high temperature requirements up to 705°F (373°C).

### TECHNICAL DATA

Sizes:	1½" x 2" to 8" x 10" (38 mm to 200 mm)
Orifices:	F 0.307 to T 26.00 in <sup>2</sup> (1.98 to 167.7 cm <sup>2</sup> )
Inlet ratings:	ANSI Class 150 to 2500
Temperature range:	to 705°F (373°C)
Set pressures:	15 to 3200 psig (1.03 to 221 barg)
Code:	ASME I, VIII and XIII (UV Designator)

# ANDERSON GREENWOOD SERIES 5200 PILOT OPERATED PRESSURE RELIEF VALVES

## PRODUCT OVERVIEW

The Series 5200's standard condensate trap condenses steam into water prior to entering the pilot, providing a liquid condensate temperature barrier between the plastic soft sealed pilot and main valve. This also creates piston seal cooling via conduction from condensing steam around the liner. There are no pilot component changes required to handle service conditions changing to and from steam and water.

Its unique design enables the main valve to be tight at pressures up to set point. After relieving and reseating, it stays bubble-tight, cycle after cycle.

## SPECIFICATIONS

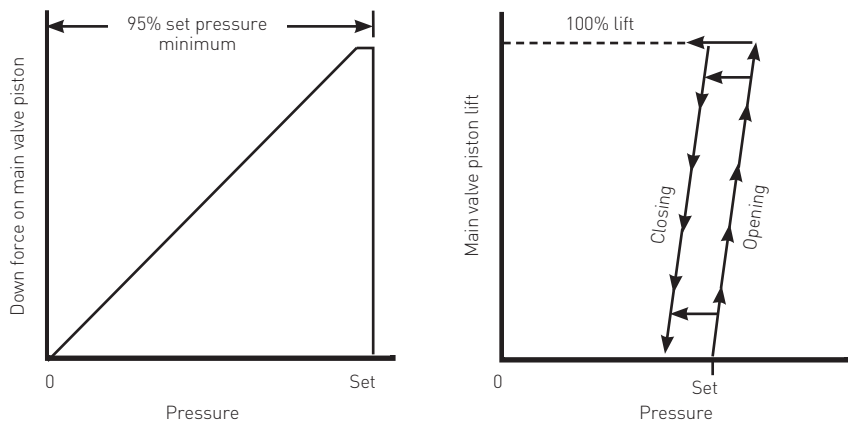

- Body bowl drain (Section I).
- Lifting lever standard on ASME Section I service.
- Pilot condensate trap standard.
- Remote sensing standard.
- Optional accessories include:
  - Field test connection
  - Pilot gag
  - Sense ring (for sensing at valve inlet)

## OPERATION

In normal operation, the system pressure acts on the area contained by the main valve seat at the bottom of the free-floating differential area piston and on the top of the piston. As the top of the piston is larger than the bottom (seat area), there is a large downward net force holding it closed. Under static conditions, the seating force increases as the system pressure increases and approaches set point.

Just prior to set pressure, the pilot opens and partially depressurizes the dome, reducing the force on the top of the piston. The set pressure is the point where the upward force on the main valve seat area can overcome the reduced downward loading. This causes the piston to lift, resulting in modulated flow through the main valve. As the main valve is relieving, the flow through the pilot stops.

When the relief demand has been satisfied, the pilot closes, full system pressure is diverted to the dome and the piston moves downwards, closing the main valve.

# ANDERSON GREENWOOD SERIES 5200 PILOT OPERATED PRESSURE RELIEF VALVES

## OPERATION

### Main valve closed

### Main valve modulating

# ANDERSON GREENWOOD SERIES 5200 PILOT OPERATED PRESSURE RELIEF VALVES

## OPERATION

Main valve open

### NOTES

1. Set pressure range is 15 - 1500 psi
2. Set pressure range is 15 - 2250 psi
3. Set pressure range is 15 - 750 psi
4. Set pressure ranges are at ambient temperature. Refer to ASME B16.5 for pressure limits at elevated temperatures.

### NOTES

1. Available in WCB body material only
2. Available in WC6 body material only
3. Limited to 285 psig set pressure
4. For set pressure above 3705 psig, increase Cmax dimension by 0.75 in (19.05 mm) and weight by 8 lbs (3.6 kgs)
5. For integral sense with RF, add 1.06" to A and Cmax dimensions. (Integral sense not offered with RTJ)

### NOTES

1. Available in WCB body material only
2. Available in WC6 body material only
3. Limited to 285 psig set pressure
4. For set pressure above 3705 psig, increase Cmax dimension by 0.75 in (19.05 mm) and weight by 8 lbs (3.6 kgs)
5. For integral sense with RF, add 1.06" to A and Cmax dimensions. (Integral sense not offered with RTJ)

1. The Napier correction factor has been supplied in the table for set pressures between 1500 psig and 3200 psig.
2. For set pressures above 3100 psig, steam is considered supercritical, and the displayed flow capacity should be multiplied by the appropriate supercritical steam correction factor.

1. The Napier correction factor has been supplied in the table for set pressures between 1500 psig and 3200 psig.
2. For set pressures above 3100 psig, steam is considered supercritical, and the displayed flow capacity should be multiplied by the appropriate supercritical steam correction factor.
